

## Round Shaft Systems Inch Series

## KXKBZ Round Shaft Systems

Expertise in linear motion.

For over 40 years INA has contributed to developments in linear technology. The results speak for themselves: our range of linear guidance systems is very comprehensive in scope, and we have the right linear guidance system for every application as well as a wide variety of useful accessories.

We also maintain an open and honest relationship with our customers by working with them consistently and competently - from the initial design concept right down to the delivery of the finished product. And we believe that providing expert advice on user applications and responding to customer requirements is an important part of our job.

In our line of shaft guidance systems you won't find any "one-size-fits-all" products. We also offer special designs for maximum load carrying capacity including open designs for support rails.

An extensive range of accessories supplements these designs, and together they form a versatile modular system that includes shaft support blocks, guideways, and precision shafts. And these products are tailor made. At our linear quick centers around the world we can machine shaft ends individually to meet the most demanding customer specifications: threaded or stepped, with radial or axial bores, with or without threads... you name it. The components you receive are ready to install.

Our modular system thus gives you plenty of options when planning your own personal design solutions. Of course, you can also get all our shaft guidance systems as complete ready-to-install units. Whatever the case, the most important thing for us is that you are fully satisfied with our product.

# Product Descriptions

INA Linear ball bearings of series KX MAX<sup>3</sup>, KBZ, KNZ are recirculating linear ball bearings which are designed to provide the following features:

- Low friction
- High rigidity
- High accuracy
- Light weight
- Low noise

Linear ball bearings of series KX MAX<sup>3</sup>, KBZ, KNZ are available in a variety of designs and sizes.

## **Series KX MAX<sup>3</sup> / KNZ - Self-Aligning Linear Ball Bearings**

Linear ball bearings of series KX / KNZ.. consist of a precision molded retainer of a high strength engineered resin and hardened and ground bearing races. Series KXO / KNZ..OP.. bearings have a segment removed for applications requiring supported shafts.

### **The KX MAX<sup>3</sup> / KNZ series offers:**

- Ground races for smoothest operation
- Self-aligning in any housing
- Interchangeable with other standard makes
- Lower noise level
- Lighter weight
- Cost effective bearing for round shaft rails

### **In addition, the KX MAX<sup>3</sup> series offers:**

- Larger load capability due to increased number of ball rows
- Greater misalignment capability
- Longer bearing life due to internal lubrication reservoirs
- Double lip seal floats with the shaft

## **KBZ Series - Precision Linear Ball Bearings**

Linear ball bearings of series KBZ and KBZ..OP consist of a hardened and ground solid outer ring and a retainer. The outer ring is machined from high-carbon bearing steel. The retainer is manufactured from a high strength engineered resin. Series KBZ..OP have a segment removed from the outer ring for applications with supported shafts.

## **Series KGX / KGNZ**

### **Self-Aligning Linear Ball Bearings With Housings**

Series KGX..PP / KGNZ..PP mounted units are manufactured of a high-strength aluminum alloy, and are supplied with a series KX / KNZ linear bearing sealed on both ends.

Series KGXO..PP / KGNZ..OP PP mounted units are supplied with a Series KNZ..OP bearing sealed on both ends for use with supported shafts.

## **Series KTX / KTNZ**

### **Self-Aligning Tandem Linear Ball Bearings With Housings**

Series KTX..PP / KTNZ..PP and KTXO..PP / KTNZ..OP PP mounted units are similar to the mounted units described above (KGX..PP / KGNZ..PP and KGXO..PP / KGNZ..OP PP) but are supplied with a longer housing and (2) KX..PP / KNZ..PP or (2) KXO..PP / KNZ..OP PP bearings installed in tandem within the housing.

## **Series WZ - Precision Shafts**

Linear shafts of series WZ are manufactured to the most precise standards which meet or exceed all industry standards (ABMA). Series WZ shafts are manufactured from a high strength steel, AISI 1055 (Cf53). They are hardened (670 840HV) and ground to precision roundness, straightness and surfaces finish specifications. Refer to dimension table on page 21.

INA Linear shafts are available in lengths up to 17' (5.18m) depending on the diameter. The shafts can be supplied cut to length and chamfered, or machined to your drawing including journals, threaded diameters, etc. If longer lengths are needed please inquire with INA Linear Engineering.

## **Series TSWZ / TSUZ - Shaft Support Rails**

Series TSWZ shaft support rails are manufactured from a high-strength aluminum alloy and are available in four foot lengths. The rails can be mounted in tandem for long-length applications. Series TSWZ..PD are supplied with drilled-through holes to standard dimensions for mounting the shaft and mounting rail to a base.

Preassembled shaft and support rail are available for ease of handling and installation. Shaft is Class L, hardened and ground steel and support rail is high strength aluminum alloy.

Series TSUZ and TSUZ..PD are similar to series TSWZ and TSWZ..PD for those applications requiring a lower height centerline to base.

## **Series GWZ - Shaft End Support Blocks**

Constructed of high strength aluminum alloy for shaft sizes 1/4" to 2" in diameter.

## Load carrying capacity and operating life

The selection of a linear ball bearing size depends on the requirements in terms of load carrying capacity, operating life and reliability in operation. When calculating the bearing life, the basic load ratings are used as a measure. The dynamic load rating applies to moving bearings as compared to applications where motion does not occur or occurs only very infrequently.

## Operating life

The basic rating life for linear ball bearings is calculated as follows:

or with the help of the graph on the following page.

$$L = \left( \frac{C}{P} \right)^3 \times 2 \times 10^6 \text{ (inches)}$$

L                   (inches)

Basic rating life reached or exceeded by 90% of a sufficiently large group of apparently identical bearings before the first evidence of material fatigue develops.

C                   (Lbs)

Basic dynamic load rating

P                   (Lbs)

Equivalent bearing load

## NOTE:

Rated life expectancy and load ratings are based on conditions which require a shaft with a surface hardness of HRC 59 minimum.

## Load safety factor

For linear ball bearings which are subject to static or shock loads, the load safety factor in terms of permissible deformation of the bearing at the ball contact points, and is defined as follows:

$S_o$                    (—)

$$S_o = \frac{C_o}{F}$$

Load safety factor

$C_o$                    (Lbs)

Basic static load rating

F                   (Lbs)

Maximum bearing load

For bearing arrangements with high requirements for accuracy and smooth running, the values for S should not be less than 3.

## Influences on the load carrying capacity

The basic load ratings given in the dimension tables apply under certain predefined conditions regarding raceway hardness, load direction and guidance accuracy. Other operating conditions must be evaluated using corresponding correction factors.

If shafts with a surface hardness lower than 59 HRC are used, then the basic load rating must be corrected according to the equations below:

$C_H$                    (Lbs)

Effective dynamic load rating

$$C_H = f_H \cdot C$$

$f_H$                    (—)

Dynamic hardness factor according to Figure 1

$C$                    (Lbs)

Basic dynamic load rating

$C_{oH}$                    (Lbs)

Effective static load rating

$$C_{oH} = f_{Ho} \cdot C_o$$

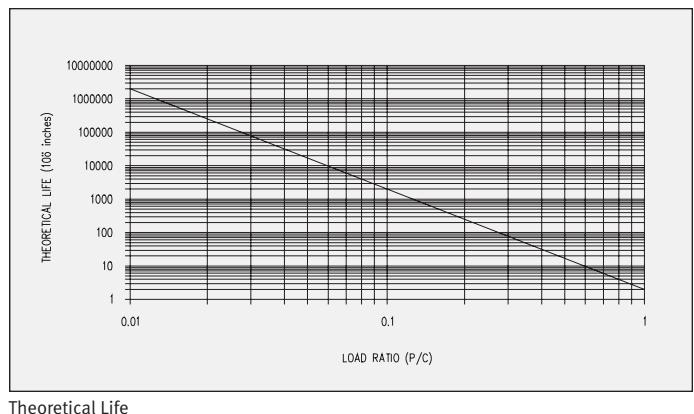

$f_{Ho}$                    (—)

Static hardness factor according to Figure 1

$C_o$                    (Lbs)

Basic static load rating

# Calculations

## Load Direction

The effective load rating of a linear ball bearing is dependent upon the orientation of the ball rows with respect to the load direction.

The load ratings in the dimension tables are indicative of the minimum load rating orientation (load case I for KNZ.., KBZ.. and load case II for KNZ..OP, KBZ..OP see Figure 2).

If the bearing orientation changes, the effective load rating can be calculated with the following formula:

$$C_W \quad (\text{Lbs})$$

$$C_W = f_s \cdot C$$

Effective dynamic load rating

$f_s$

Dynamic load direction factor (Table 1)

$$C_{oW} \quad (\text{Lbs})$$

$$C_{oW} = f_o s \cdot C_o$$

Effective static load rating

$f_o s$

Static load direction factor (Table 1)

# Design & Installation

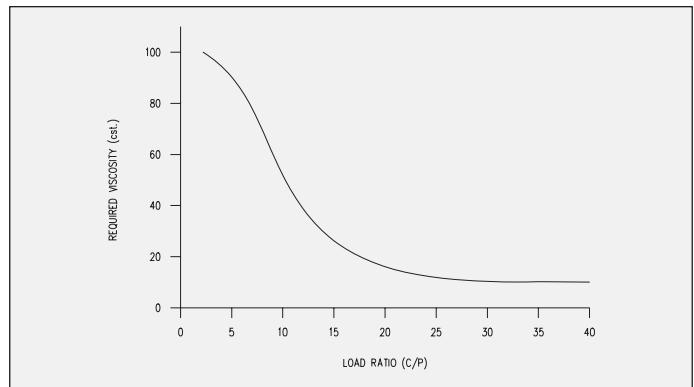

Figure 3 Required Lubricant Viscosity For KBZ, KNZ Bearings

## Lubrication

Proper lubrication is an important prerequisite for long service life of any anti-friction bearing.

For non-sealed bearings oil lubrication is preferred in order to guarantee adequate lubrication of all rolling contact areas and to wash away contaminants if necessary.

Grease lubrication is also possible, providing economic advantages as compared to oil lubrication. Greases to NLGI 3 are recommended. To ensure that adequate lubrication of the rolling elements is provided refer to INA recommendations in Figure 3.

## Operating data

Linear ball bearings of series KBZ, KNZ can withstand acceleration up to 50m/sec<sup>2</sup> (5g) and speeds of 4m/s (13ft./sec).

The ball bearing series KX can withstand the same acceleration but speeds up to 5m/sec.

Continuous operating temperatures of -20°C (-4°F) to +80°C (+176°F) are permissible.

## Installation

Assembly and location of linear ball bearings KBZ, KNZ. These bearings are easy to install. Smaller bearings can be pushed into their housing bores by hand, but for larger bearings, it is advisable to use a fitting arbor as shown on Figure 4. Housing bores should be chamfered.

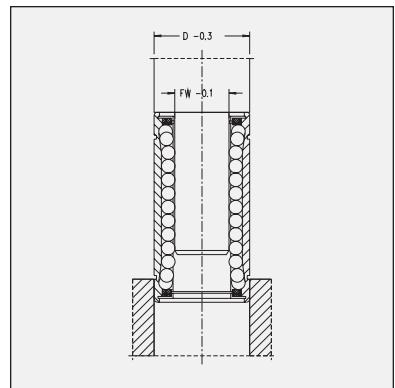

Figure 4 Assembly Of Linear Ball Bearings Series KBZ, KNZ

# Design & Installation

## Axial location of closed linear ball bearings

Bearings of series KX, KBZ, KNZ are installed with a clearance fit and should be axially located. The simplest method of location is with the use of retaining rings as shown in Figure 5.

## Axial and rotary location of linear ball bearings

Linear ball bearings of series KXO.., KBZ..OP, KNZ..OP must be located against axial and rotary displacement.

If set screws are used, they should be secured by adhesive to prevent rotation.

## Operating clearance and its adjustment

Depending on the bearing design, the desired operating clearance of a bearing arrangement can be achieved either by adjusting the bearing enveloping circle or by matching the bearing to suitable housing and/or shaft diameters.

An appropriate clearance between the bearing and the shaft is required for operation. The proper clearance is obtained when the bearings are mounted with our shafts Class L and housing dimensions in shown in the Mounting Dimensions table below.

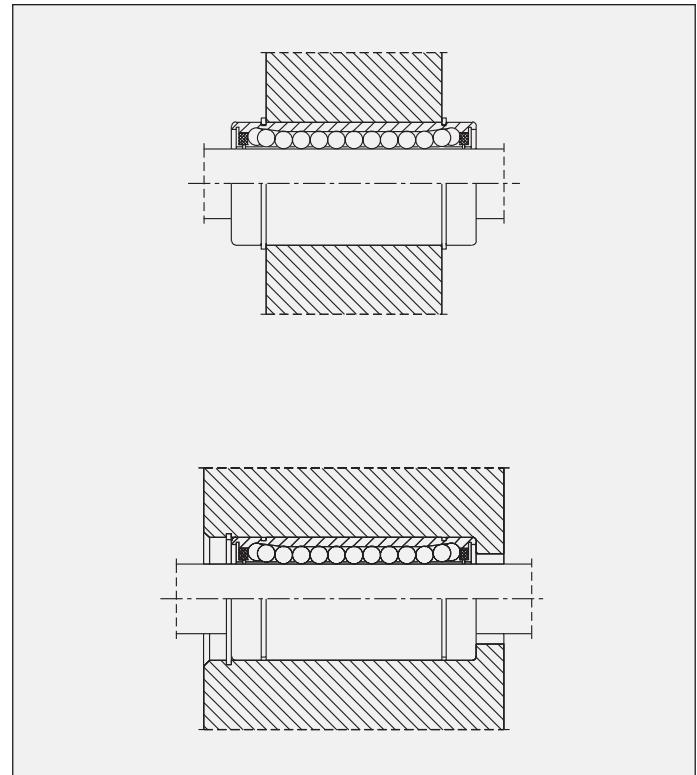

Figure 5 Series KNZ Linear Ball Bearings - Possible Methods Of Axial Location

1) Linear ball bearings sealed on both sides: suffix "PP"

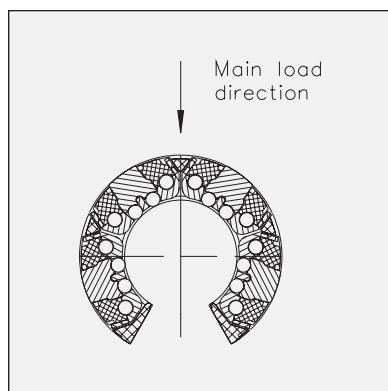

2) Load ratings apply only for hardened (670 to 840 HV) and ground shaft raceways.

3) Load rating in main load direction

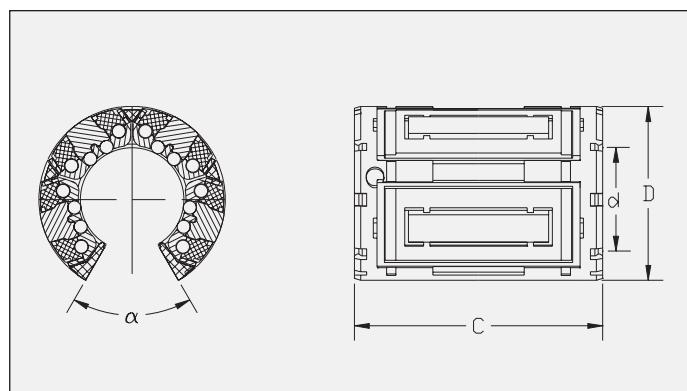

4) Load ratings to ISO/C 14 728-1 (maximum values)

1) Maximum length L = 48

2) The dimension C is dependent on the length of the support rail. It should always be equal at both ends

3) With reference to the nominal shaft diameter, measured while clamped
