Foreword

Track roller guidance systems LF are preferably used, due to their lightweight construction, for tasks in handling systems, where quiet running, high speeds and long travel distances are required together with uniformly low displacement resistance.

Economical due to modular concept

In order to cover a wide range of requirements using standard components, the guidance systems are structured according to a modular concept. The system elements, namely carriages, composite guideways, track rollers and a precisely matched range of accessories can be combined to achieve designs that are precisely matched to the application.

Carriages

Carriages of the LF family are supplied as:

- economical, lightweight hollow section carriages
- robust open carriages for high performance guidance systems of a simple construction
- closed compact carriages for use where guidance systems must operate in contaminated environments
- non-locating carriages for locating and non-locating bearing applications with two guidance systems in a parallel arrangement
- bogie carriages for curved tracks or closed oval and circular guidance systems.

Guideways

Composite guideways are available as solid and hollow section guideways, with a support rail of high bending rigidity, as a half guideway, a curved guideway element or a flat type. Guideways with slots for toothed racks or toothed belts are also available.

Profiled track rollers

Profiled track rollers without filling slots are used to guide the carriages and support the forces. These double row angular contact ball bearings have an outer ring with a gothic arch profile raceway, are sealed on both sides and are greased for life. They can support axial loads from both sides and high radial forces due to the thick-walled outer ring.

Accessories

The spectrum of positive characteristics of our track roller guidance systems is completed by a comprehensive, precisely matched range of accessories for the system components.

Replacement for ...

The new catalogue replaces the section on track roller guidance systems in Schaeffler Group Catalogue 801. The data represent the state of current technology and manufacture as at March 2008. They take account of the progress in rolling bearing technology as well as the experience gained through practical application. Data in earlier catalogues as well as in Product and Market Information publications that do not correspond to the data in this catalogue are therefore invalid.

Safety guidelines and symbols

High product safety

Our products correspond to the current level of research and technology. If the bearing arrangement is designed correctly, the products are handled and fitted correctly and as agreed and if they are maintained as instructed, they do not give rise to any direct hazards.

Follow instructions

This publication describes standard products. Since these are used in numerous applications, we cannot make a judgement as to whether any malfunctions will cause harm to persons or property. It is always and fundamentally the responsibility of the designer and user to ensure that all specifications are observed and that all necessary safety information is communicated to the end user. This applies in particular to applications in which product failure and malfunction may constitute a hazard to human beings.

Definition of guidelines and symbols

The warning and hazard symbols are defined along the lines of ANSI Z535.6–2006.

The meaning of the guidelines and symbols is as follows.

If they are not observed, minor or slight injury will occur.

Caution 

Attention!

If they are not observed, damage or malfunctions in the product or the adjacent construction will occur.

Note!

There follows additional or more detailed information that must be observed.

①

Numbers within a circle are item numbers.

Load carrying capacity and life

Permissible radial loads

The thick-walled outer rings of the track rollers can support high radial loads. If these track rollers are used against a shaft as a raceway, the outer rings undergo elastic deformation, *Figure 1*.

Compared to rolling bearings supported in a housing bore, track rollers have the following characteristics:

- modified load distribution in the bearing.
This is taken into consideration by the basic load ratings C_{r_w} and C_{0r_w} that are decisive for life calculation.
- bending stress in the outer ring.
This is taken into consideration by the permissible radial loads $F_{r_{per}}$ and $F_{0r_{per}}$. The bending stresses must not exceed the permissible strength values of the material (due to the risk of fracture).

Permissible radial load under dynamic loading

Attention!

For bearings under dynamic circumferential load, the effective dynamic load rating C_{r_w} is used.

C_{r_w} is used to calculate the basic rating life.

The permissible dynamic radial load $F_{r_{per}}$ must not be exceeded.

If the basic static load rating C_{0r_w} is lower than the basic dynamic load rating C_{r_w} , C_{0r_w} is used.

Figure 1

Deformation of the outer ring when used against a flat raceway

Permissible static radial load

Attention!

For bearings under static load, when stationary or with only infrequent motion, the effective static load rating C_{0r_w} is used. C_{0r_w} is used to calculate the static load safety factor S_0 .

The permissible static radial load $F_{0r_{per}}$ must not be exceeded.

In addition to the permissible radial load of the bearing, the permissible radial load of the mating track must also be taken into consideration.

The basic load ratings stated are valid only in conjunction with a shaft as a mating track that is hardened (at least 670 HV) and ground (R_a 0,3).

Fatigue limit load

The fatigue limit load C_{ur_w} is defined as the load below which – under laboratory conditions – no fatigue occurs in the material.

Calculation of the rating life

The general methods for calculating the rating life are:

- the basic rating life to DIN ISO 281
- the adjusted rating life to DIN ISO 281
- the expanded calculation of the adjusted reference life to DIN ISO 281-4.

These methods are described in Catalogue HR1, Rolling Bearings, in the section Technical Principles, Load carrying capacity and life.

Life values for track rollers

In comparison with Catalogue HR1, Rolling Bearings, the following values must be exchanged:

- $C_r = C_{rw}$
- $C_{0r} = C_{0rw}$
- $C_{ur} = C_{urw}$

The carriages LFCL, LFL...SF, LFL, LFKL and the bogie carriage LFDL contain four track rollers LFR.

The equivalent principle applies here.

The corresponding parameters are taken into consideration in the basic load ratings C_y , C_{0y} , C_z , C_{0z} and the permissible moment ratings M_{0x} , M_{0y} and M_{0z} .

C_y	N
Basic dynamic load rating in y direction	
C_{0y}	N
Basic static load rating in y direction	
C_z	N
Basic dynamic load rating in z direction	
C_{0z}	N
Basic static load rating in z direction	
M_{0x}	Nm
Static moment rating about X axis	
M_{0y}	Nm
Static moment rating about Y axis	
M_{0z}	Nm
Static moment rating about Z axis.	

In the case of track rollers with a profiled outer ring, calculation is carried out exclusively by means of the basic rating life to DIN ISO 281.

Figure 2
Load carrying capacity
and load directions

Load carrying capacity and life

Other formulae for calculating the basic rating life

$$L_s = 0,0314 \cdot D_a \left(\frac{C_{rw}}{P_r} \right)^p$$

$$L_h = 26,18 \cdot \frac{D_a}{H \cdot n_{osc}} \left(\frac{C_{rw}}{P_r} \right)^p$$

$$L_h = 52,36 \cdot \frac{D_a}{\bar{v}} \left(\frac{C_{rw}}{P_r} \right)^p$$

Rating life for carriages with four track rollers

$$L_s = \left(\frac{C_y, C_z}{P} \right)^p$$

$$L_h = \frac{1666}{\bar{v}} \cdot \left(\frac{C_y, C_z}{P} \right)^p$$

$$L_h = \frac{833}{H \cdot n_{osc}} \cdot \left(\frac{C_y, C_z}{P} \right)^p$$

Number of return strokes per minute

\bar{v} m/min

Mean travel velocity

p -

Ball: $p = 3$;

needle roller (non-locating track roller or carriage): $p = 10/3$.

Operating life The operating life is the life actually achieved by a rolling bearing. It may differ significantly from the calculated rating life.

This may be due to wear or fatigue as a result of:

- deviations in the operating data
- insufficient or excessive operating clearance (roller, guideway)
- contamination
- inadequate lubrication
- operating temperature too high or too low
- reciprocating motion with very small stroke length, which can lead to false brinelling
- vibration – false brinelling
- very high shock loads (static overloading)
- prior damage during installation.

Due to the variety of installation and operating conditions, it is not possible to precisely determine the operating life in advance. The most reliable way of arriving at a close estimate is by comparison with similar applications.

Load carrying capacity and life

Static load safety factor

The parameter for static loading is the static load safety factor S_0 . This indicates the security against impermissible permanent deformations in the bearing and is determined by means of the following formula:

$$S_0 = \frac{C_{0r w}}{F_{0r}}$$

Static load safety factor for carriages with four track rollers

$$S_0 = \frac{C_{0r}}{F_0}$$

$$S_0 = \frac{M_0}{M}$$

S_0 Static load safety factor

$C_{0r w}$ Effective static load rating according to dimension table

F_{0r} Maximum radial load on track roller

C_{0r} Basic static load rating according to dimension table

F_0 Maximum load in x, y, z direction

M_0 Permissible static moment in x, y, z direction

M Equivalent static moment rating in load direction (M_x, M_y, M_z).

Track rollers are regarded as heavily loaded at a static load safety factor of $S_0 < 4$.

For applications with normal operating conditions, a value $S_0 > 4$ is required.

When using individual track rollers, for example in conjunction with guideways, the permissible load of the guideway should be taken as decisive where necessary.

Attention! Static load safety factors $S_0 < 1$ lead to plastic deformations of the rolling elements and raceway, which can impair smooth running. This is only permissible for bearings with small rotary motions or in secondary applications.

Minimum load

In order to ensure that the outer ring is driven and to prevent slippage or lifting of the track roller from the mating track, the track rollers must be subjected to a minimum load in dynamic operation.

Attention! In general, the minimum load is determined by the ratio $C_{0r w}/F_r < 60$.

Differences in raceway hardness

If shafts with a lower surface hardness are used (such as X46, X90), a hardness factor must be applied, see formula and *Figure 3*.

$$C_H = f_H \cdot C$$

$$C_{OH} = f_{OH} \cdot C_0$$

C N
Basic dynamic load rating
C₀ N
Basic static load rating
C_H N
Effective dynamic load rating
C_{OH} N
Effective static load rating
f_H –
Dynamic hardness factor
f_{OH} –
Static hardness factor.

① LFS.-RB, W.-X90
② W.-X46
f_{OH}, f_H = hardness factor
HV, HRC = surface hardness

Figure 3

Static and dynamic hardness factors for lower hardness of raceways

Lubrication

Lubrication of guideway raceways

The guideway raceways must be lubricated (even before first use). Lubrication can be carried out by means of lubrication and wiper units.

These units are already integrated in the compact carriage LFKL. For carriages LFL and LFCL, the lubrication and wiper unit AB is available as an accessory, page 94.

The guideway raceway is lubricated by an oil-soaked felt insert. Oil can be fed to the felt inserts via lubrication nipples in the end faces. At delivery, the felt inserts are already soaked with oil (H1 approval for the food industry), where relubrication is to be carried out an oil of viscosity 460 mm²/s is recommended.

Lubrication intervals

The lubrication intervals for guideway raceways are dependent on the environmental influences. The cleaner the environment, the smaller the quantity of lubricant required. The time and quantity can only be determined precisely under operating conditions since it is not possible to calculate all the influences in advance. A sufficiently long observation period must be allowed.

Attention!

Fretting corrosion is a consequence of inadequate lubrication and is visible as a reddish discolouration of the mating track or outer ring. Inadequate lubrication can lead to permanent system damage and therefore to failure. It must be ensured that the lubrication intervals are reduced accordingly in order to prevent fretting corrosion.

In general, a thin film of oil should always be present on the shaft.

Lubrication of track rollers

At delivery, track rollers LFR have an initial greasing of a high quality lithium soap grease.

From LFR5204-16, the inner ring has a relubrication hole. The smaller track roller diameters are lubricated for life.

Further information on lubrication

Further information can be found in Catalogue HR1, Rolling Bearings, in the section Lubrication.

Figure 1
Lubrication of guideway raceways

Design of bearing arrangements

Requirements for the adjacent construction

The running accuracy of the linear guidance system is essentially dependent on the straightness, accuracy and rigidity of the mounting surfaces.

The higher the requirements for accuracy and smooth running of a track roller guidance system, the more attention must be paid to the geometrical and positional accuracy of the adjacent construction. The adjacent surfaces should be flat and have parallel faces.

For two guideways, we recommend parallelism to *Figure 1*.

Figure 1
Parallelism of guideways

Shaft creep

Under unfavourable conditions, shaft creep of a few millimetres may occur in isolated cases. This creep may occur mainly in applications with high accelerations in conjunction with high alternating loads and guideways that are not completely supported. It may also be caused by an adjacent construction that is too soft.

In such cases, shaft creep can be prevented by the use of end plates ANS.LFS; for information on end plates, see page 100. They can be supplied already mounted.

Displacement force

The displacement force is dependent on the preload, the lubrication and the particular application. It is therefore not possible to make generally valid statements.

Location of carriages and guideways

If lateral loads are present, it is recommended that the guideways and carriages should be located against locating surfaces. In the case of guideways comprising multiple sections joined together, it is recommended that the guideways should be aligned by means of the shaft. If necessary, the shafts should be located on the adjacent construction by means of dowels.

If two guideways are arranged in parallel, the first guideway should be clamped against a stop, *Figure 1*. The second guideway should then be aligned accordingly. Any gaps between the guideway and the adjacent construction should be filled with resin.

Design of bearing arrangements

Track roller guidance systems in accordance with customer specifications

The INA track roller guidance systems with curved guideway elements can be used to achieve an extremely wide variety of applications, *Figure 2* and *Figure 3*.

If the arrangement required cannot be represented using the standard ordering designation, a customer drawing must be submitted with the enquiry.

For arrangements with curved guideway elements, it is recommended that the guideway connector VBS should be used at the joints, see page 99. This gives considerably easier mounting.

Fitting

Delivered condition

Carriages are delivered with the track rollers fitted. All the bolts are tightened to the required tightening torque.

Carriages

For carriages, this gives the following characteristics:

- hollow section carriage LFCL; clearance-free, with mounting of accessories as necessary.
- compact carriage LFKL...-SF; clearance-free, with mounting of lubrication and wiper unit as necessary.
- non-locating carriage LFLL...-SF; clearance-free, with mounting of accessories as necessary.
- open carriage LFL...-SF; clearance-free, with mounting of accessories as necessary.
- bogie carriage LFDL...-SF, LFDL...-B; LFDL...-SF clearance-free, with mounting of accessories as necessary.
In the case of LFDL...-B, the clearance must be set by means of the eccentric bolts.

Fitting of guidance system with one guideway

- Place the guideway on the adjacent construction and screw mount finger tight.
- Align the guideway; if necessary, clamp the shaft against the locating edge and screw mount firmly, observing the tightening torques.
- Clearance-free carriages: slide the carriage onto the guideway.
- Carriages with adjustable clearance: if lateral load is present, ensure that the principal load is supported by the concentric bolts.
- Position and screw mount the adjacent construction.

Fitting of guidance system with two guideways

- Position the first guideway, clamp it against the locating edge and tighten the screws.
- Position the second guideway and tighten the screws finger tight.
- Slide the carriage onto the guideway, set the clearance if necessary, *Figure 2*, page 25.
- Position the adjacent construction, align the carriage and screw mount firmly; observe the tightening torques M_A , table page 26.
- Align the second guideway with the aid of the table, move the table several times during this operation.
- Tighten the fixing screws in the guideway; tightening torques M_A , table page 26.

Where necessary, physical locking can be achieved between the guideways and adjacent construction by means of resin or strips.

Fitting of bogie carriages

Slide the clearance-free carriage LFDL...SF onto the guideway. No setting of clearance is required, *Figure 1*.

Carriages with adjustable clearance

Slide the carriage LFDL...B onto the guideway and set in position without load. Rotate the eccentric bolts using an open-end wrench or ring wrench so that the track rollers are set against the raceway, observing the direction of rotation, *Figure 2*.

Tighten the hexagonal nut to the tightening torque M_A ; tightening torques, table Tightening torques for track roller bolts, page 26.

Attention!

The track rollers must be easily movable and clearance-free. If they are set in place too firmly, this will generate preload that reduces the life of the guidance system.

Inspection

Check the adjustment. The guidance system is correctly adjusted if, when the carriages are moved, all the track rollers rotate and the carriages can be moved easily.

The concentric bolts are tightened to the necessary tightening torque, the eccentric bolts are tightened finger tight. When setting the preload, these must be tightened to the tightening torque M_A , table page 26.

Accuracy

Accuracy of guideways LFS

Data on the straightness, parallelism (differential measurement), length and positional tolerances of guideways are given in the following tables and figures, *Figure 1* to *Figure 5*.

The guideways are precision straightened and the tolerances are better than DIN EN 12 020.

Length tolerance

L mm		Tolerance mm
Single-piece guideways	$L < 1\,000$	± 2
	$1\,000 \leq L < 2\,000$	± 3

Ordering example Ordering designation

Ready-to-fit systems

The elements of the track roller guidance systems (such as the carriage, guideway) must be ordered separately.

Carriages should be regarded as a unit, including the track rollers and bolts.

Carriages and guideways can be used in any combination and can be ordered independently of each other.

Ordering example

Track roller guidance system, corrosion-resistant design, with open carriage LFL52-E-SF, *Figure 1* and *Figure 2*.

Carriage	Carriage	LFL

Operating limits

- Operating temperature** Track roller guidance systems can be used at temperatures from $-20\text{ }^{\circ}\text{C}$ to $+80\text{ }^{\circ}\text{C}$. For applications below $-20\text{ }^{\circ}\text{C}$ or above $+80\text{ }^{\circ}\text{C}$, please contact us.
The area of application is restricted by the lubricant, the plastics used and the composite materials.
- Speeds** The maximum possible speed of track roller guidance systems is 10 m/s . Higher speeds may be possible by agreement.
- Acceleration** When using track roller guidance systems, accelerations of up to 50 m/s^2 can be achieved.

Track roller guidance systems

Features

Track roller guidance systems are available with a hollow section carriage, compact carriage, open carriage, non-locating carriage or bogie carriage.

Track roller guidance system with hollow section carriage

The economical series LFCL is characterised in particular by its low mass and high moment load carrying capacity M_x . In addition, more individual design of the adjacent construction is possible since the T-bolts can be moved longitudinally in the carriage plate.

A carriage comprises a carriage plate made from anodised aluminium, four concentric bolts, four track rollers, two end covers for the hollow sections and eight T-nuts, *Figure 1*. The track rollers and end covers are already fitted.

Preload and clearance

The carriages run clearance-free on all INA guideways, see page 38, and can be combined with all guideways of the relevant size, but not with the curved guideway elements LFSR.

Due to the highly accurate guideways, it is not necessary to set the clearance.

Sealing and lubrication

The track rollers have gap seals on both sides, are greased for life and are therefore maintenance-free.

The raceways can be lubricated using cap wipers AB...LFR. Their fixing screws pass into the screw mounting channels of the carriage plate.

Corrosion-resistant design

All steel parts, the inner and outer rings of the track rollers and the bolts, washers and nuts are made from corrosion-resistant steel. The rolling elements are protected against corrosion by the grease.

Corrosion-resistant designs have the suffix RB.

Further information

Further information is given on the following pages:

- dimension table see page 48
- track rollers and bolts see page 60, 64
- guideways see page 66
- accessories see page 92.

- ① T-nut
- ② End cover
- ③ Carriage plate
- ④ Track roller
- ⑤ Concentric bolt

Figure 1
Hollow section carriage

Track roller guidance system with compact carriage

The closed compact carriage LFKL...SF gives a simple means of achieving track roller guidance systems for operation in contaminated environments. The track rollers are protected against contamination by the closed design. It has two integrated lubrication units for lubrication of the raceways.

A compact carriage comprises a saddle plate made from anodised, profiled aluminium, four concentric bolts, four track rollers, two sealing strips and two lubrication and wiper units, *Figure 2*. The track rollers are already fitted, the sealing strips as well as the lubrication and wiper units are included loose in the delivery.

Preload and clearance

The carriages run clearance-free on all INA guideways, see page 38, and can be combined with all guideways of the relevant size, but not with the curved guideway elements LFSR. Due to the highly accurate guideways, it is not necessary to set the clearance.

Sealing and lubrication

The track rollers have gap seals on both sides, are greased for life and are therefore maintenance-free.

For lubrication of the raceways, the lubrication and wiper units have oil-soaked felt insert that can be replenished with oil via lubrication nipples. In combination with the sealing strips (gap seals), these units protect the compact carriage on all sides against contamination.

Corrosion-resistant design

All steel parts, the inner and outer rings of the track rollers and the bolts, washers and nuts are made from corrosion-resistant steel. The rolling elements are protected against corrosion by the grease. Corrosion-resistant designs have the suffix RB.

Further information

Further information is given on the following pages:

Track roller guidance systems

Track roller guidance system with open carriage

The robust open carriage LFL...-SF is suitable where efficient linear guidance systems of a simple construction are required.

A carriage comprises a carriage plate made from anodised aluminium, four screws and four track rollers, *Figure 3*. The track rollers are already fitted.

Preload and clearance

The carriages run clearance-free on all INA guideways, see page 38, and can be combined with all guideways of the relevant size, but not with the curved guideway elements LFSR. Due to the highly accurate guideways, it is not necessary to set the clearance.

Sealing and lubrication

The track rollers have gap seals on both sides, are greased for life and are therefore maintenance-free.

The raceways can be lubricated by means of lubrication and wiper units AB, page 92. Their oil-soaked felt inserts can be replenished with oil via lubrication nipples. In combination with side plates ABAL, these units seal the end faces and longitudinal sides of the open carriage, page 93.

Corrosion-resistant design

All steel parts, the inner and outer rings of the track rollers and the screws, washers and nuts are made from corrosion-resistant steel. The rolling elements are protected against corrosion by the grease. Corrosion-resistant designs have the suffix RB.

Further information

Further information is given on the following pages:

- dimension table see page 52
- track rollers and screws see page 60, 64
- guideways see page 66
- accessories see page 92.

- ① Carriage plate
- ② Screws
- ③ Track roller

Figure 3
Open carriage

Track roller guidance system with non-locating carriage

Non-locating carriages LFL...-SF are robust, ready-to-fit linear guidance systems that are used exclusively in locating or non-locating bearing applications with two parallel guideway systems. The track rollers can be axially displaced. In this way, it is possible to compensate for inaccuracies of ± 1 mm in relation to the spacing of the guideways.

A carriage comprises a carriage plate made from anodised aluminium, four screws and four non-locating track rollers, *Figure 4*. The track rollers are already fitted.

Preload and clearance The carriages run clearance-free on all INA guideways, see page 38, and can be combined with all guideways of the relevant size, but not with the curved guideway elements LFSR. Due to the highly accurate guideways, it is not necessary to set the clearance.

Sealing and lubrication The track rollers have gap seals on both sides, are greased for life and are therefore maintenance-free. The contact zone between the raceways and track rollers must be lubricated via the shaft.

Corrosion-resistant design All steel parts, the inner and outer rings of the track rollers and the screws, washers and nuts are made from corrosion-resistant steel. The rolling elements are protected against corrosion by the grease. Corrosion-resistant designs have the suffix RB (available by agreement only).

Attention! Non-locating carriages must never be used on their own but only ever in combination with locating carriages.

The track rollers can support loads in a radial direction only.

Further information Further information is given on the following pages:

- dimension table see page 54
- track rollers and screws see page 60, 64
- guideways see page 66
- accessories see page 92.

- ① Carriage plate
- ② Screw
- ③ Non-locating track roller

Figure 4
Non-locating carriage

Track roller guidance systems

Track roller guidance system with bogie carriage

Bogie carriages LFDL can be used in combination with curved guideway elements LFSR to achieve almost any variant of oval and circular track guidance systems. The straight guideway elements are precisely matched to the arc. The carriages are available in the design LFDL..-SF (with four concentric bolts) and design LFDL..-B (two concentric and two eccentric bolts).

A carriage comprises a steel carriage plate, two aluminium swivel brackets (supported axially and radially by rolling bearings), four concentric bolts or two concentric and two eccentric bolts, *Figure 5*. The track rollers are already fitted.

Preload and clearance

The carriage LFDL..-B is set clearance-free in relation to the guideway by means of the eccentric bolts.

Carriage LFDL..-SF cannot be adjusted, since the carriage is already optimally adjusted to the INA guideways, see page 38.

Sealing and lubrication

The track rollers have gap seals on both sides, are greased for life and are therefore maintenance-free.

The contact zone between the raceways and track rollers must be lubricated via the shaft.

Corrosion-resistant design

All steel parts, the inner and outer rings of the track rollers and the bolts, washers and nuts are made from corrosion-resistant steel. The rolling elements are protected against corrosion by the grease.

Corrosion-resistant designs have the suffix RB (available by agreement only).

Attention!

The adjustable carriage LFDL..-B must be used in combination with a 360° guideway.

Product overview Track rollers

Locating track roller

LFR

Non-locating track roller

LFR..-2RSR-NA

LFR..-2RSR-RNA

Track rollers

Features Track rollers LFR are double row angular contact ball bearings comprising an outer ring with a gothic arch profile, an inner ring and two ball and cage assemblies with plastic cages. The inner ring and outer ring are made from rolling bearing steel 100Cr6.

The special outer ring gives two point contact in the contact zone with the raceway, *Figure 1*. The contact angle is a maximum of 30°.

The bearings can support axial forces from both directions as well as radial forces.

Track rollers

Sealing and lubrication

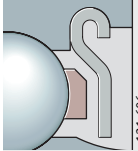

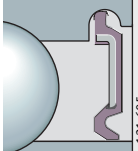

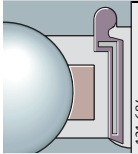

Gap seals on both sides protect the rolling element system against contamination. Bearings with this seal type have the suffix 2Z.

The track rollers are also available on request with contact seals on both sides, suffix 2RS and 2RSR.

The track rollers are greased for life and are therefore maintenance-free. From outside diameter ≥ 52 mm, the inner ring has a lubrication bore.

Seal types

For seal types and their specific features, see table.

 <p>121 606</p>	<p>2Z seal</p> <p>Gap seal:</p> <ul style="list-style-type: none"> ■ not radially preloaded ■ low friction ■ to be used with low levels of contamination
 <p>121 605</p>	<p>2RSR seal</p> <p>Contact seal:</p> <ul style="list-style-type: none"> ■ radially preloaded ■ to be used with higher requirements for sealing action and under heavy contamination
 <p>121 684</p>	<p>2RS seal</p> <p>Contact seal:</p> <ul style="list-style-type: none"> ■ axially preloaded ■ to be used with higher requirements for sealing action and under heavy contamination

Corrosion-resistant design

The inner ring and outer ring are made from corrosion-resistant steel. The rolling elements are protected against corrosion by the grease.

Corrosion-resistant designs have contact seals and the suffix 2RS-RB or 2RSR-RB.

Accuracy and internal clearance

The dimensional and geometrical accuracies correspond to tolerance class PN to DIN 620.

The radial internal clearance corresponds approximately to class CN; for internal clearance classes, see Catalogue HR1, Rolling Bearings.

Further information

Further information is given on the following pages:

- dimension table see page 74, 78, 79
- bolts see page 64
- guideways see page 66
- accessories see page 92.

Possible combinations of track rollers and guideways

The tables show the possible combinations of track rollers with the guideways LFS and TS.

Combinations with guideways LFS

¹⁾ Shaft and support rail units TS and shaft diameter d_{LW} see Catalogue WF1, Shaft Guidance Systems.

Design and safety guidelines Adjacent construction for non-locating track rollers

For non-locating track rollers without an inner ring, the rolling element raceway on the shaft must be hardened and ground. The surface hardness must be 670 HV + 170 HV. The hardening depth CHD or R_{ht} must be sufficiently large. For design of the shaft see table.

Tolerances and surface data for the shaft raceway

Diameter tolerance of shafts		Roughness max.	Roundness max.	Parallelism max.
Without inner ring	With inner ring			
k5	g6 (with point load)	R _a 0,4 (R _z 2)	25% of diameter tolerance	50% of diameter tolerance

Product overview Bolts

Concentric

LFZ

LFZ..-A1

Eccentric

LFE

LFE..-A1

Bolts

Features

The bolts, which are made from high strength screw steel, are available with a concentric and eccentric collar; designation LFZ or LFE. Depending on their intended purpose, they are supplied with a washer, nut, drive fit lubrication nipple and sealing cap, see table Delivered condition.

The eccentric designs LFE and LFE..-A1 allow the track roller guidance systems to be set clearance-free.

Delivered condition

Designation and suffix	Included in delivery	Design
LFZ	Concentric bolt with washer	Standard
LFE	Eccentric bolt with washer and nut	Standard
LFZ..-A1 LFE..-A1	Concentric or eccentric bolt with washer and nut, drive fit lubrication nipple and sealing cap	Standard
NIP-A2	Drive fit lubrication nipple	Accessory
VD2	Sealing cap	Accessory

Lubrication

Bolts LFZ..-A1 and LFE..-A1 have a lubrication hole. Track rollers of outside diameter ≥ 52 mm can be lubricated via this hole. A lubrication nipple NIP-A2 can be pressed into the hole, *Figure 1*. If the hole will not be used for relubrication, it must be closed off using the sealing cap VD2.

- ① Drive fit lubrication nipple NIP A2
- ② Sealing cap VD2

Figure 1

Drive fit lubrication nipple and sealing cap

Corrosion-resistant design

In this case, the bolts, washers and nuts are made from corrosion-resistant steel. These designs have the suffix RB.

Further information

Further information is given on the following pages:

- dimension table see page 76
- track rollers see page 60
- guideways see page 66
- accessories see page 92.

Product overview Guideways

**Guideways
without fixing holes**

All LFS guideways with the exception of LFSR are also available without fixing holes; suffix OL.

Guideways

Design and safety guidelines Guideway hole patterns

Unless specified otherwise, the guideways have a symmetrical hole pattern, *Figure 1*.

Upon request, an asymmetrical hole pattern may be available. In this case, $a_L \geq a_{L \min}$ and $a_R \geq a_{R \min}$.

Figure 1
Hole patterns of guideways with one row of holes

Hole pitch values

The hole pitch values j_L are stated in the dimension tables. For high loads, guideways are available with reduced hole pitch values j_L , *Figure 2*.

These guideways have the suffix E or EE; examples: LFS...-E, LFS...-EE.

Figure 2
Hole pitch values j_L

Maximum number of pitches between holes

The number of pitches between holes is the rounded whole number equivalent to:

$$n = \frac{l - 2 \cdot a_{L \min}}{j_L}$$

The distances a_L and a_R are generally determined by:

$$a_L + a_R = l - n \cdot j_L$$

For guideways with a symmetrical hole pattern:

$$a_L = a_R = \frac{1}{2} \cdot (l - n \cdot j_L)$$

Number of holes:

$$x = n + 1$$

a_L, a_R	mm
Distance between start or end of guideway and nearest hole	
$a_{L \min}, a_{R \min}$	mm
Minimum values for a_L, a_R according to dimension tables	
l	mm
Guideway length	
n	-
Maximum possible number of hole pitches	
j_L	mm
Distance between holes	
x	-
Number of holes.	

Attention!

If the minimum values for a_L and a_R are not observed, the counterbores of the holes may be intersected.

Guideways

Multi-piece guideways

If single-piece guideways are not possible, guideways LFS can be assembled from matched and marked sections, *Figure 3*.

① Marked joints

Figure 3

Multi-piece guideways

Two guideways LFS can have a deviation from each other at the joint of:

- $\Delta a = \pm 0,01 \text{ mm}$
- $\Delta h_4 = \pm 0,05 \text{ mm}$, *Figure 4*.

Figure 4

Deviation at the joint on guideways assembled from sections

Guideways without holes

All guideways LFS are available without holes, with the exception of LFSR. These guideways have the suffix OL, for example LFS..OL.

Non-locating track rollers also available without inner ring: LFR..-2RSR-RNA.

Note the guidelines relating to the adjacent construction, see page 63.

Corrosion-resistant design available by agreement.

- ¹⁾ Effective dynamic load rating as track roller (radial).
- ²⁾ Effective static load rating as track roller (radial).
- ³⁾ Fatigue limit load.
- ⁴⁾ Lubrication hole in inner ring (diameter) 2 mm.

Possible combinations of track rollers and bolts

Guideways in corrosion-resistant design: LFS...-RB, note page 17.

Guideways LFS, LFS...C and LFS...F available without holes: LFS...OL, LFS...C OL, LFS...F OL.

Modulus of elasticity for LFS...C, LFS...CE, LFS...CEE, LFS...E, LFS...EE, LFS...F, LFS...FE: 72 000 N/mm².

- 1) Maximum length of single-piece guideways; longer guideways are supplied in several sections and are marked accordingly.
- 2) a_L and a_R are dependent on the guideway length l_{\max} , for calculation see page 70.
- 3) Under maximum load F_z and F_{0z} , support washers DIN 433 and the maximum tightening torque according to the table, page 26, are required.
- 4) The design of the hollow sections is dependent on the size.
- 5) Counterbore depth for screws DIN 7 984.
- 6) If support washers to DIN 433 are used, screws to DIN 7 984 are recommended.
- 7) Hole patterns Z and ZZ are available by agreement.

Attention!

If these curved guideway elements are required in combination with straight guideway sections, these must always be ordered together as a unit.

Closed oval tracks can only be ordered as a single unit.

One unit comprises two curved guideway elements LFSR with an arc of 180° and two straight guideway sections LFS or a unit comprises four curved guideway elements LFSR with an arc of 90° and four straight guideway sections LFS.

- 1) Maximum length of single-piece guideways.
- 2) For fixing screw to DIN ISO 4 762-8.8.
- 3) Number of holes on the pitch circle r_1 .

Accessories

Features

Connectors for guideways

Guideway connectors VBS are accessories for curved and straight LFS guideways.

They comprise:

- pins
- bushes
- grub screws.

The guideway connectors are suitable for all LF guideways.

Curved guideways to be joined are supplied with the guideway connector as standard. Straight guideways to be joined can be supplied with the guideway connector as an option.

The VBS reduces running noise at the joint, ensures an increased operating life for the guidance system and improves the operational reliability.

End plates

End plates ANS.LFS (also for use with hollow section guideways) are made from steel. They secure the rolled-in raceway shafts by the physical locking principle. In the case of solid section guideways, holes must be made in the end faces (by the customer) for screw mounting of the end plates.

The end plates prevent the shaft creep that can occur under unfavourable conditions on all guideways that comprise an aluminium support rail into which a steel shaft is rolled or pressed.

Attention!

These can be supplied already fitted, but this must be indicated when ordering.

Lubrication and wiper units

Type AB.W

The lubrication and wiper unit AB.W comprises a plastic housing and is fixed to the adjacent construction. It contains a felt lubrication insert. This is supplied soaked with oil that has H1 approval and can be replenished with oil via a hole in the housing if necessary.

Lubrication and wiper units AB.W are supplied with fixing screws.

Type AB

The lubrication and wiper unit AB comprises a plastic housing and is screw mounted to the end of the carriage LFL or LFDL. It contains felt lubrication inserts on both sides. These are supplied soaked with oil that has H1 approval and can be replenished with oil via lubrication nipples if necessary. The lubrication and wiper units AB can be fixed to carriages using two screws.

Cap wipers

The cap wipers comprise a plastic housing and are slid over the track roller from below. They contain felt lubrication inserts on both sides. These are supplied soaked with oil that has H1 approval and can be replenished with oil via lubrication nipples if necessary.

The cap wipers can be fixed using two screws to the screw mounting channels in the carriage LFCL and thus seal the track rollers from below at the screw head. When bolts LFZ and LFE are used in an application design, there is a gap that can be sealed, for example using silicone.

Cap wipers are supplied with fixing screws.

Type AB.LFR

If two or more AB.LFR are used per side, the displacement resistance can be reduced by removing the felt insert on the inner side.

AB.LFR are suitable for mounting on the carriage LFCL42 as well as customer designs. For mounting on the carriage LFCL42, the upper cover must be replaced by the two covers supplied, *Figure 1*.

- ① For mounting on the customer design
- ② For mounting on LFCL42

Figure 1
Mounting on the carriage LFCL

Type AB.LFR5302

An exception is the cap wiper AB.LFR5302. This comprises an end cover and a relubrication and wiper unit AB.W10 that can be screw mounted to either the right or left of the end cover. Its function and location correspond to those of the other sizes.

Accessories

Side plates The side plate ABAL is made from plastic and can be screw mounted to the sides of the carriage LFL...-SF.
The side plates are used to supplement the lubrication and wiper units AB. The carriage can be sealed on all sides, with the exception of the underside, by means of two side plates and two lubrication and wiper units.
The side plate is supplied with fixing screws.
It can only be mounted in conjunction with the lubrication and wiper unit AB.

Stops

Type PAH The stop PAH comprises anodised aluminium and a buffer made from shock-absorbent plastic. The stop can be placed at any position on the guideway. It is then clamped in place by means of a screw.
The stop is used as an end stop or restricts the travel of the carriage. If the carriage is to run up against a stop PAH, the central section of lubrication and wiper units must be removed.

Type PASTP The stop PASTP is made from plastic. It can be screw mounted in a threaded hole (to be made by the customer) in the guideway. This hole can be drilled at any position on the guideway LFS.
The stop is used as an end stop or restricts the travel of the carriage. If the carriage is to run up against a stop PASTP, the central section of lubrication and wiper units must be removed.

End covers End covers KA are made from plastic. The end covers close off the end faces of the hollow sections in guideways LFS...-C, LFS...-M and LFS...-CH and in the hollow section carriage LFCL.

Slot closing strips Slot closing strips NAD are made from plastic. They close off the slots in the guideway LFS...-M.
For information on NAD, see publication ALE, Driven Linear Units.

Fasteners

Fixing brackets, fixing lugs

For location of LFS-M with the integral profiled aluminium support rail, fixing brackets and fixing lugs are available, *Figure 2, Figure 3, Figure 4* and table Fasteners and designations, page 98.
